Employment

- November 2025 – Present **Instituto Eldorado**, *Senior Software Engineer*, Campinas, Brazil - Remote
- Languages and frameworks used: TypeScript, React, Python, FastAPI, GCP (Cloud Run, Pub/Sub, GCS, Cloud SQL), Terraform, PM2, Tailwind CSS 4, Ant Design, Gemini AI
 - Serving as technical reference and engineering lead for a team of 7 developers building enterprise products for Motorola (Lenovo), mentoring interns and junior engineers.
 - Architected scalable distributed systems leveraging GCP Pub/Sub for asynchronous event-driven messaging across decoupled microservice boundaries, enhancing fault tolerance.
 - Provisioned and managed hybrid infrastructure across GCP (Cloud Run, Cloud Storage, Cloud SQL PostgreSQL) and dedicated bare-metal VMs monitored via PM2, leveraging Terraform for declarative IaC automation.
 - Integrated AI-driven development workflows leveraging Google Gemini and engineering best practices, accelerating delivery velocity while preserving strict code review boundaries.
 - Refactored frontend architecture by leveraging Zustand for global state and TanStack Query for asynchronous cache synchronization, enhancing data throughput and UI responsiveness.
 - Engineered a drag-and-drop device layout configuration engine leveraging @dnd-kit, establishing clean component boundaries with Ant Design and Tailwind CSS 4.
 - Collaborated with Motorola product stakeholders to define technical boundaries for complex features, translating domain constraints into robust system architecture.
- January 2024 – November 2025 **Bosch**, *Senior Software Engineer*, Campinas, Brazil - Remote
- Languages and frameworks used: Java, Spring, JavaScript, React, GitHub Copilot, Selenium, Jenkins
 - Modernized legacy frontend by embedding React components into an existing jQuery architecture, establishing clean interface boundaries between legacy scripts and modern reactive interfaces.
 - Adapted and implemented enterprise design system from ETAS (Bosch company), standardizing UI components and enhancing user experience (UX).
 - Designed automated testing strategies for legacy components and authored comprehensive E2E integration tests using Selenium.
 - Conducted rigorous peer code reviews to ensure code quality, architectural consistency, and team-wide engineering excellence.
 - Delivered features and bug fixes iterated through SCRUM sprints via Jira, maintaining CI/CD automated pipelines with Jenkins.

July 2022 – **Spocket**, *Frontend Engineer*, Vancouver, Canada - Remote

- January 2024
- Languages and frameworks used: JavaScript, TypeScript, React, Next.js, Python, Django, Celery, Generative AI (GPT), GitHub Copilot, AWS (S3, CloudFront, Amplify), CircleCI, GitHub Actions, Sentry
 - Architected asynchronous processing pipelines in Django leveraging Celery to decouple long-running generative AI (GPT).
 - Participated in bootstrapping new products (including supplier-facing Next.js apps and Django/React platforms), defining component boundaries, boilerplate scaffolding, and the core design system.
 - Refactored CI/CD pipelines migrating execution environments from CircleCI to GitHub Actions with AWS S3 and CloudFront, cutting build times by 50% (15 minutes faster), hence substantially reducing infrastructure billing.
 - Enhanced client-side observability and error tracing by leveraging Sentry, resolving critical exceptions across application boundaries to achieve an 80% reduction in production errors and warnings.
 - Modernized legacy codebase by refactoring class-based components to modern functional React with Hooks, React Query, and Redux/Context API, enhancing runtime performance and maintainability.
 - Scaled unit test coverage to 80% with Jest and React Testing Library (RTL) leveraging GitHub Copilot to rapidly synthesize test suites for complex edge cases, establishing testing boundary guides for the team.
 - Iterated product features within agile SCRUM sprints (Jira, ZenHub, Monday.com), enforcing modular code boundaries through rigorous peer code reviews.

April 2021 – **Dasa**, *Software Engineer*, São Paulo, Brazil - Remote

- July 2022
- Languages and frameworks used: JavaScript (ES6+), React, PropTypes, React Query (TanStack), styled-components, Ant Design, Jest, React Testing Library, Jenkins, SonarQube, Fortify
 - Engineered a genomic examination tracking platform for bioinformatics and clinical genetics teams, building visual pipeline interfaces to monitor end-to-end genetic sequencing workflows.
 - Refactored client state architecture by decoupling global state from Redux ('unreduxing'), leveraging React Query for server cache synchronization and Context API for local state, hence eliminating unnecessary boilerplate.
 - Integrated Dasa's custom design system with Ant Design UI and styled-components, refactoring legacy class components into modern functional components with PropTypes contract validation to enhance DX.
 - Established a comprehensive unit testing culture from a zero-coverage baseline, engineering test suites with Jest and React Testing Library (RTL) to systematically reach 80% code coverage.
 - Optimized CI/CD automation pipelines in Jenkins, embedding SonarQube code quality gates and Fortify security analysis while reducing build execution latency by 30%.
 - Iterated clinical examination features and resolved interface defects within agile SCRUM sprints managed via Jira.

August 2020 – April 2021 **Softwrap**, *Full Stack Engineer*, São Paulo, Brazil - Remote

- Languages used: Javascript and Typescript
- Worked with React and React Native, Node.js, Firebase and Docker
- I was responsible to coordinate a specific team for the development of a hybrid application using React Native and Firebase for meal tickets from a disclosed company
- Led a team of 3 developers
- Helped and taught the less skilled developers
- Created a pixel perfect React Native application for accountability of accounting firms

- February **SmartEnvios**, *Full Stack Engineer*, Ribeirão Preto, Brazil
- 2020 – June ○ Languages used: Javascript, HTML5, CSS3, Shellscript
- 2020 ○ Worked as Full Stack Engineer with React, Gatsby, TailwindCSS, Node.js, PostgreSQL, MongoDB and Docker
- Created company's website using Gatsby and TailwindCSS
 - Developed crawlers using Node.js, Puppeteer and Cheerio for scraping and crawling.
 - Deployed on LightSail, uploading the exchange data to S3 and registering all operations in PostgreSQL.
 - The monitoring process was done using PM2 and the deploying of this related service.

Education

- 2012 – 2020 **BSc in Biomedical Informatics**, *Universidade de São Paulo*, Ribeirão Preto, São Paulo, Brazil
- During my BSc in biomedical informatics I worked as a intern researcher in bioinformatics
 - Gained expertise in data analysis using R, more specifically ggplot2, tidyr, dplyr, bioconductor packages (like limma and GEOQuery), and the creation of dashboards using Shiny.
 - Also had classes such as Algorithm and Data Structures, Object Orient Programming, Databases and SQL, Machine Learning, Operating Systems and Distributed Systems.
 - Learn the basics of C, C++, Java and R.
